---

John,

We geocoded the addresses from the "Property" table in the database file. We were able to get 97% of the records to plot, which is pretty good. I have a total of about 2035 points (see attached ROUGH map). I have no idea which attribute shows which houses were "abated". There IS a record called "Underground\_ACM", and that field is populated by either a '0' or a '1'. If I select the '1' only, I get about 1400 total records -- BUT I still have no idea if this is the field to select which properties have been "abated"??? Do you have any idea which field shows this?

I will attach the map just to show you where the points fell.
